4.11 Exercise: Advanced scatterplots for deeper analysis – *R version*

Note: *Copying and pasting text (e.g. R code) from a pdf is not reliable. For that reason we have also provided the code in a text file*

This exercise will enable you to explore more complicated relationships between variables and the explore the effects of a third and fourth variable, enabling you to view changes over time.

The skills addressed are:

1. Create a scatterplot of two numeric variables, subset by a 3rd variable.
2. Explore the effect of a third and fourth variable using colour and size.

We will use the **gapminder** dataset (but **not** *gapminder_2008*).

Create a scatterplot of two numeric variables, subset by a 3rd variable

We are going to explore the relationship between the variables **Infantmortality** and **ChildrenPerWoman** of countries in the **Gapminder** dataset over time.

#R Code	Output and/or Commentary
# Setup library(iNZightPlots) library(FutureLearnData) **data(gapminder)**	

# Scatterplot of Infantmortality against ChildrenPerWoman iNZightPlot(**ChildrenPerWoman,Infantmortality** , data=**gapminder**)	# Subset by Year_cat iNZightPlot(ChildrenPerWoman,Infantmortality, **g1=Year_cat**, data=gapminder)	# Change size and colour of points iNZightPlot(ChildrenPerWoman,Infantmortality,g1=Year_cat, data=gapminder, **colby=Region, sizeby=Populationtotal**)	# Show results for 1972 only iNZightPlot(ChildrenPerWoman,Infantmortality,**g1=Year_cat,** **g1.level="[1972]"**,data=gapminder, colby=Region, sizeby=Populationtotal)	***# Darker background** (often easier to see some of the lighter dots)* iNZightPlot(ChildrenPerWoman,Infantmortality, g1=Year_cat, g1.level="[1972]",data=gapminder, colby=Region, sizeby=Populationtotal, **bg="darkgray**")	
 # Try transparency and smaller points *(removed garkgray)*

```
iNZightPlot(ChildrenPerWoman,Infantmortality, g1=Year_cat,
        g1.level="[1972]",data=gapminder, colby=Region,
        sizeby=Populationtotal, alpha=.45, cex.dotpt=.5)
```

 # Try subsetting by different years, **e.g.** g1.level="[1976]",

 # Label some of the extreme points *(ask for 4)*

```
iNZightPlot(ChildrenPerWoman,Infantmortality, g1=Year_cat,
        g1.level="[1972]",data=gapminder, colby=Region,
        sizeby=Populationtotal, alpha=.45, cex.dotpt=.5,
        locate.extreme=4, locate=Country)
```

 # Label some specific countries

```
ids = (1:nrow(gapminder))[gapminder$Country %in%
            c("United States of America","China","Brazil", "India")]

iNZightPlot(ChildrenPerWoman,Infantmortality, g1=Year_cat,
        g1.level="[1972]",data=gapminder, colby=Region,
        sizeby=Populationtotal, alpha=.45, cex.dotpt=.5,
        locate.id=ids, locate=Country)
```

 # Allow a little more room on left to accommodate label

```
iNZightPlot(ChildrenPerWoman,Infantmortality, g1=Year_cat,
        g1.level="[1972]",data=gapminder, colby=Region,
        sizeby=Populationtotal, alpha=.45, cex.dotpt=.5,
        locate.id=ids, locate=Country, xlim=c(0,9))
```

 # Subset by a fourth variable (Region)

```
iNZightPlot(ChildrenPerWoman, Infantmortality, g1=Year_cat,
g2=Region, g2.level="America", data=gapminder, colby=Region)
```

 # Play through the years

```
for (k in levels(gapminder$Year_cat)) {
iNZightPlot(ChildrenPerWoman,Infantmortality, g1=Year_cat,
        g1.level=k, data=gapminder, colby=Region,
        sizeby=Populationtotal, alpha=.45, cex.dotpt=.5,
        locate.id=ids, locate=Country)
       Sys.sleep(1)
}
```

- **Play some more with these settings and try other variables**
- For even more settings, type **?inzpar** into R to get help on the inzpar, or type **inzpar** to just get a complete list (last time I looked the help file wasn't entirely complete)

To discuss issues related to this Exercise,
